Paid Pain Assessment

NaturalleeGoode

Griffen Bon, Girwan Dhakal, Lily Oswald, Jay Kumar Roy,

Iteration 2 Presentation | October 27, 2026

Sponsor: Mia Miller

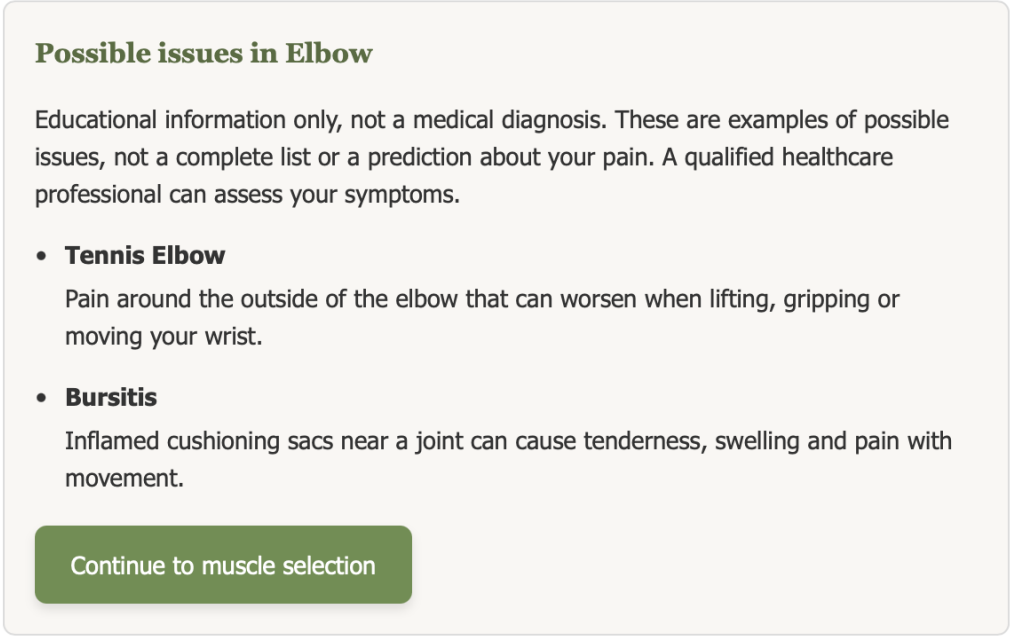

Project Goal

- Enhance the existing online pain-assessment and consultation-intake experience
- Make it easier for clients to describe pain and identify affected body regions
- Improve how clients are directed to appropriate consultation options
- Support both independent use and guided use with Mia

Speaker: Lily Oswald

Iteration Goal

- Simplify the existing body map with basic and advanced viewing options
- Improve body-region information using sponsor feedback
- Refine selection, reset, and search behavior
- Improve Calendly routing and form-submission feedback
- Investigate and document privacy requirements

Speaker: Girwan Dhakal

Planned work

- Create “simple” and “advanced” modes with different levels of detail
- Regroup body parts and update problems as directed by sponsor
- Fix bugs and missing information
- Customize Calendly integration
- Ensure HIPAA-compliance
- Work out sponsor’s existing hosting solution

Speaker: Griffen

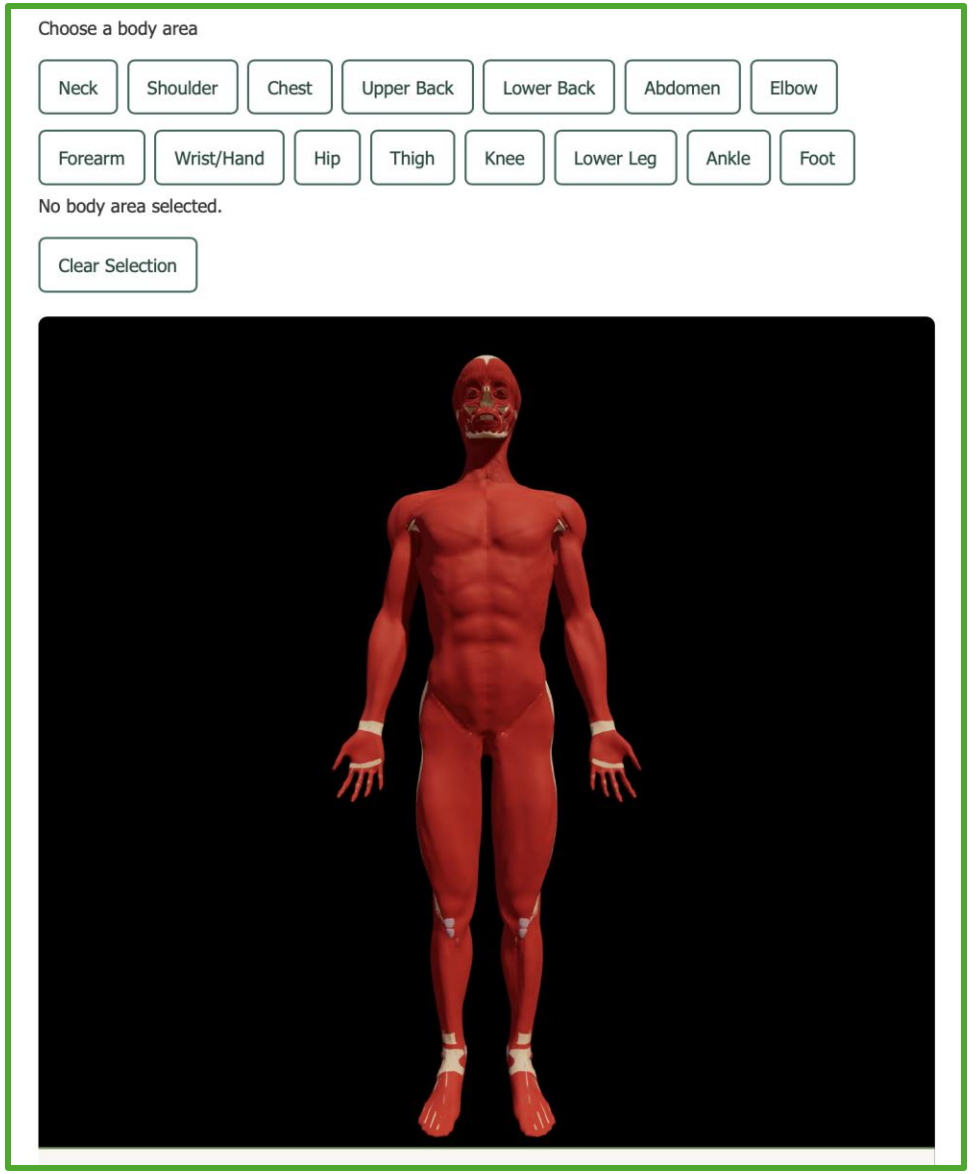

Deviations

- GCB - HIPAA compliance was not required since the sponsor does not interact with Health Insurance
- Changes made but not confirmed due to scheduling conflicts with the sponsor
- Investigation with hosting and permissions not fully resolved.

Speaker: Jay

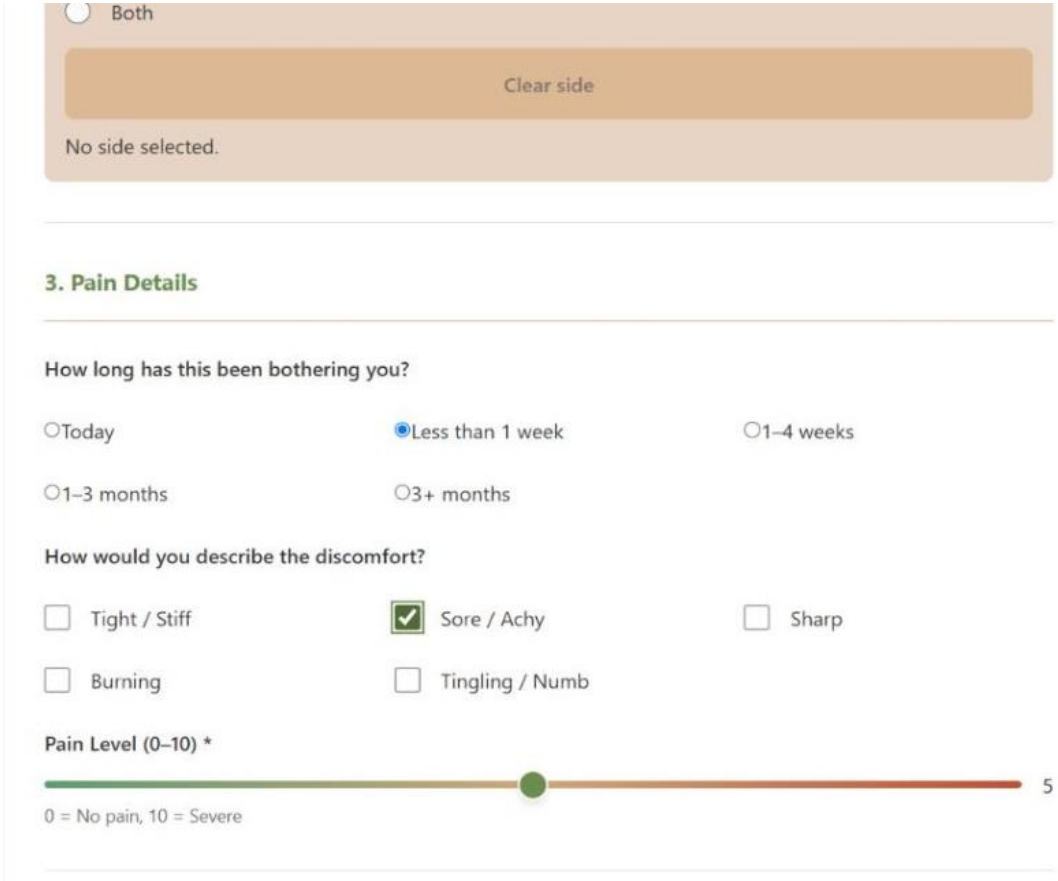

Accomplishments

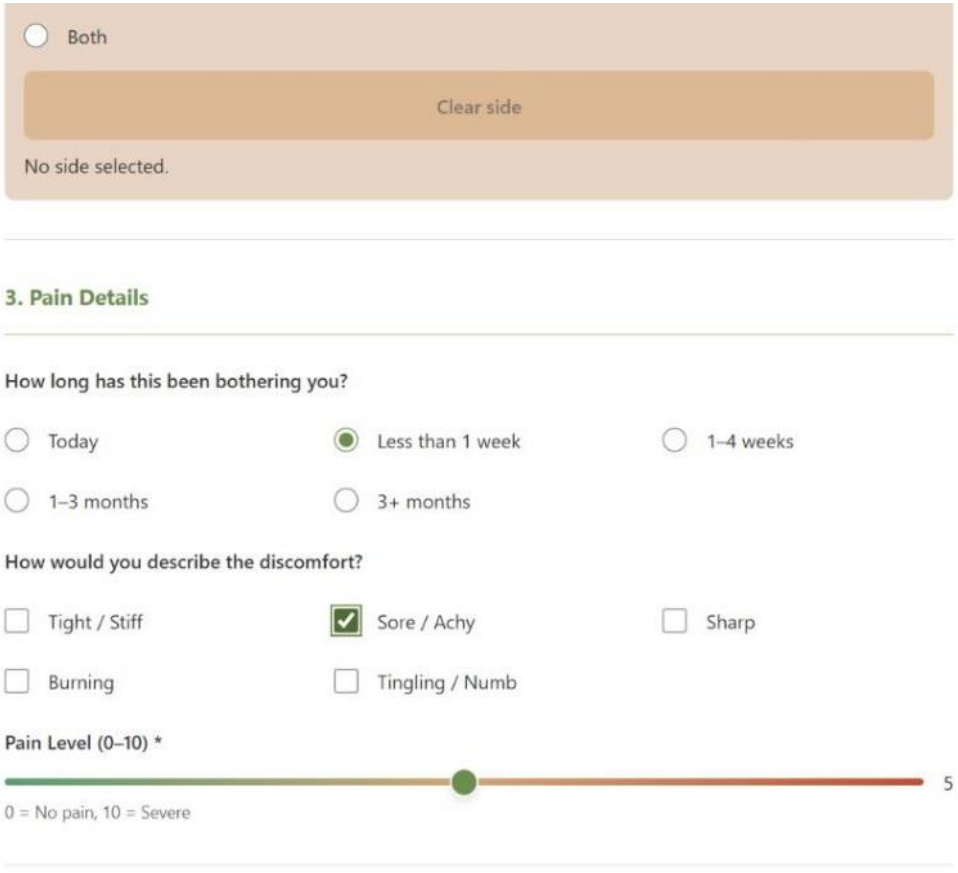

- Validated the advanced body-map mode with the sponsor
- Enhanced the body map with a simplified client view
- Updated body regions and muscle mappings based on sponsor feedback
- Updated Calendly integration

Speaker: Lily Oswald

UI Fixes: Before vs After

Before vs After: Simple vs Advanced Mode

Clear Selection

Possible issues in Shoulder

Educational information only, not a medical diagnosis. These are examples of possible issues, not a complete list or a prediction about your pain. A qualified healthcare professional can assess your symptoms.

- **Rotator cuff tear or tendon irritation**
  Damage or irritation affecting the tendons that help lift and rotate your arm.
- **Shoulder impingement**
  A shoulder tendon rubbing against nearby tissue or bone, which can hurt when you raise your arm.
- **Frozen shoulder**
  Pain and stiffness that make the shoulder difficult to move.
- **Shoulder bursitis**
  Inflamed cushioning sacs near a joint can cause tenderness, swelling and pain with movement.

Continue to muscle selection

Engineering & Quality

•GitHub Actions validates HTML, checks JavaScript syntax, and runs automated and browser tests.

•Browser testing covers body-area selection, reset behavior, keyboard controls, and mobile layouts.

•Failure testing verifies that body-area information remains usable when the 3D model fails to load.

•GitHub issues and PRs document changes with test results, screenshots, and known limitations.

Speaker: Girwan Dhakal

Team Contributions

- Girwan
  - 10 PRs opened, 6 approved. Area content (#105, #109–110), modes/model clicks (#118–119), intake UI (#128), and course docs (#99–100, #131–132).
- Griffen
  - HIPAA compliance (#77)
  - Calendly integration (#107)
  - UI tweaks (#52, #93)
- Jay
  - Body-map muscle search and intake selection (#85, #86)
  - Workflow testing and highlight fixes (#87, #88)
  - Hosting investigation (#68)
- Lily
  - UI changes (#90, #92)
  - Body region selection (#74, #91, #121)

Speaker: Girwan, Griffen, Jay, Lily

Lessons learned

- Girwan: We need to better coordinate PR review and approval to prevent the PRs from backing up. I also learned about form accessbility and design.
- Jay – Learned to inspect HTTP headers and trace website infrastructure to identify hosting providers, external integrations, and the source code behind web applications.
- Griffen- I misinterpreted the requirements of issue #52. I delivered a PR that didn't quite match what the team wanted.
  - In the future, meet with team whenever an assigned issue has a change in requirements
- Lily – I learned that changes to shared body-map state can affect area, side, muscle, highlighting, and reset behavior, so the complete selection flow must be retested after every enhancement.

Speaker: Girwan, Jay, Griffen, Lily

AI use

- Girwan- Used AI to assist with coding and explaining difficult concepts. I also used Codex to help draft documents.
- Griffen- used AI to explain existing code. Suggested code changes were verified for correctness
- Jay- Used Codex (GPT-Sol-6) to investigate HTTP headers and site hosting pathway. Also, used research to analyze the codebase
- Lily- Used Codex to analyze existing code and support body-map enhancements, then verified the changes through automated tests, browser testing, and code review.
